

UNIVERSITÀ DEGLI STUDI DI MILANO

SEMINARI ERC

Data

Venerdì 2 Febbraio 2018, ore 11:00

Aula Montanari, Dipartimento di Chimica

Oratore

Prof. Frank Grossmann

Institut fuer Theoretische Physik
Technische Universitaet Dresden

Titolo

"Semiclassical initial value representations: Basics and applications to quantum dissipation"

Coordinatore

Michele Ceotto

Dipartimento di Chimica

Abstract:

The semiclassical initial value formalism to solve the time-dependent Schroedinger equation will be reviewed. Special focus will be laid on Heller's thawed and frozen Gaussians [1], as well as on the Herman-Kluk propagator [2]. A combination of the frozen and thawed Gaussian methods for many degree of freedom systems, the semiclassical hybrid dynamics [3], will then be introduced.

After a brief digression to the semiclassical description of the scattering of two identical particles [4], we present results for the quantum-classical transition of a nonlinear oscillator coupled to an Ohmic heat bath [5], as well as for the thermalization of the expectation values of such an oscillator [6]. We contrast two different approaches to open system dynamics: the explicit treatment of the bath degrees of freedom and the reduced density matrix method, respectively.
