There is an open subset of Stab(X) embedded into  $\text{Stab}(D^{b}(\mathbb{P}^{N}))$ .

#### Remark

The functor  $i_*$  induces stability conditions from Stab(X) to  $\text{Stab}(D^b(\mathbb{P}^N))$  but the behaviour is not so nice.

 $\begin{array}{c} Stability \ conditions\\ Inducing \ stability \ conditions\\ Enriques \ surfaces\\ The \ canonical \ bundle \ of \ \mathbb{P}^1\end{array}$ 

The setting The result

## The case N = 1

For N = 1, the best result we get is the following:

#### Theorem C (M.-M.-S.)

An open subset of  $\text{Stab}(D^b(\mathbb{P}^1))$  embeds into Stab(X) as a fundamental domain for the action of the autoequivalences group.

The setting The result

## The case N = 1

For N = 1, the best result we get is the following:

#### Theorem C (M.-M.-S.)

An open subset of  $\text{Stab}(\mathbb{D}^b(\mathbb{P}^1))$  embeds into Stab(X) as a fundamental domain for the action of the autoequivalences group.

#### Remark

As a by-product we get a simple proof of the connectedness and simply-connectedness of the space Stab(X). This was previously proved by Okada and, more generally, by Ishii-Uehara-Ueda.
